

Contents

Preface, ix

Acknowledgments, xiii

Part I: Building blocks of fibrillation, 1

Excitation and propagation, 1

Source-sink relationships, 2

What determines source-sink balance?, 3

Propagation and reentry, 4

Requirements for reentry, 4

What makes a circuit?, 6

Source-sink balance and rotors, 6

Wave length, 8

Wave length, path length, and reentry, 9

Restitution, 10

Initiating reentry, 11

Part II: Atrial fibrillation mechanisms, 21

The evolution of current concepts, 21

The mass hypothesis of atrial fibrillation, 30

Principles of propagation: Implications for fibrillation, 32

Focal rotors, 52

Micro-reentry, 55

Fibrillatory conduction or multi-wavelet reentry?, 66

Location of atrial fibrillation drivers, 76

Principles of propagation: Driver interactions in fibrillation, 87

Part III: Working with incomplete information, 93

Cardiac mapping, 93

Sample density and atrial fibrillation, 115

What should we do with the patient who comes to the lab *tomorrow*?

Putting it all together (without “it all”), 128

Putting it all together: Atrial fibrillation in three questions, 132

Appendix A: Calculating probability in a random walk, 135

Appendix B: Dominant frequency analysis, 137

Appendix C: A stupid idea, but a learning opportunity, 143

References, 149

Index, 161
