For a few of the titles in this list (only a few) we received help from ChatGPT, that we openly acknowledge. Initially we were surprised that AI could be witty; but of course AI has acquired 'data' from e.g. Terry Pratchett and P G Wodehouse, not just from Dante Alighieri and William Shakespeare.

This brings up a sticky issue: in the realm of science, is it advisable or even allowed to use ChatGPT at all? Our short answer is yes. A more articulate answer includes the following. (1) You can ask simple or complex questions, but you must always check ChatGPT's replies by finding and reading the original sources in the scientific literature. (2) You can broach a topic with ChatGPT just for the purpose of elaborating on your own ideas. (3) If you disagree with ChatGPT, consider it may be wrong: stick to your guns.

Artificial intelligence should stimulate, not thwart natural intelligence.
